A telescopic series

I want to calculate the value of the series $\sum_{n=1}^{\infty} \frac{1}{n^2 + 2n}.$

1. Find a formula for the *k*-th partial sum $S_k = \sum_{n=1}^k \frac{1}{n^2 + 2n}$.

$$Hint: \quad \frac{1}{n^2 + 2n} = \frac{A}{n} + \frac{B}{n+2}$$

2. Using the definition of series, compute the value of

$$\sum_{n=1}^{\infty} \frac{1}{n^2 + 2n}$$

What is wrong with this calculation? Fix it

Claim:
$$\sum_{n=1}^{\infty} \ln \frac{n}{n+1} = \ln 2$$

$$\sum_{n=2}^{\infty} \ln \frac{n}{n+1} = \sum_{n=2}^{\infty} [\ln n - \ln(n+1)]$$

$$= \sum_{n=2}^{\infty} \ln(n) - \sum_{n=2}^{\infty} \ln(n+1)$$

$$= (\ln 2 + \ln 3 + \ln 4 + \dots) - (\ln 3 + \ln 4 + \dots)$$

$$= \ln 2$$

Trig series: convergent or divergent?

$$2. \sum_{n=0}^{\infty} \cos(n\pi)$$

Help me write the next assignment

In the next assignment I want to give you a series and ask you to calculate its value from the definition. I want the sequence of partial sums $\{S_n\}_{n=1}^{\infty}$ to be

What series should I ask you to calculate?

What can you conclude?

Assume $\forall n \in \mathbb{N}, \ a_n > 0$. Consider the series $\sum a_n$.

Let $\{S_n\}_{n=0}^{\infty}$ be its sequence of partial sums.

In each of the following cases, what can you conclude about the *series*? Is it convergent, divergent, or we do not know?

- 1. $\forall n \in \mathbb{N}$, $\exists M \in \mathbb{R} \text{ s.t. } S_n \leq M$.
- 2. $\exists M \in \mathbb{R} \text{ s.t.} \quad \forall n \in \mathbb{N}, \qquad S_n \leq M.$

Are all decimal expansions well-defined?

We had defined a real number as "any number with a decimal expansion". Now we understand what it means to write a number with an infinite decimal expansion. It is a series!

$$0.a_1a_2a_3a_4a_5\cdots = \frac{a_1}{10} + \frac{a_2}{100} + \frac{a_3}{1000} + \dots$$

for any "digits" a_1 , a_2 , a_3 , ...

But this raises a question: are these series always convergent, no matter which infinite string of digits we choose?

Yes, they are! Prove it. (Hint: all the terms in the series are positive.)
